During spring and summer, monarchs breed throughout the U.S. and southern Canada. In the fall, adults of an eastern population migrate to Mexico for the winter. The following spring, these butterflies fly northward, many crossing Georgia. To survive these long journeys, monarchs need nectar from flowering plants all along their route and milkweed on which to lay eggs in spring. The eggs hatch into caterpillars that can only eat milkweed leaves.

Milkweed and other native butterfly host plants have been reduced in recent years due to a number of factors, including human development, agriculture, mowing, climate change, and the use of chemical weed killers (herbicides). Some scientists are concerned the spread of tropical milkweed (Asclepias curassavica) in the U.S. has negative impacts on monarch migration. To avoid potential risks of growing tropical milkweed, cut it to the ground in late fall and also include Georgia native milkweeds and nectar plants in your garden.

Monarchs east of the Rockies have declined significantly since 1995. During spring and summer, monarchs breed throughout the U.S. and southern Canada. In the fall, adults of an eastern population migrate to Mexico for the winter. The following spring, these butterflies fly northward, many crossing Georgia. To survive these long journeys, monarchs need nectar from flowering plants all along their route and milkweed on which to lay eggs in spring.
